

# GIFT: Genetics Informatics Trial of Warfarin Therapy for Deep Venous Thrombosis Prevention

Brian F. Gage, MD, MS<sup>1</sup>, Anne R. Bass, MD<sup>2</sup>, Hannah Lin<sup>1,3</sup>,  
Scott C. Woller, MD<sup>4,5</sup>, Scott M. Stevens, MD<sup>4,5</sup>, Noor  
Al-Hammadi, MBChB, MPH<sup>1</sup> and Charles S. Eby, MD  
on behalf of the GIFT Investigators

1 Washington University in Saint Louis, St. Louis;

2 Hospital for Special Surgery, New York;

3 University of Massachusetts, Worcester;

4 Intermountain Healthcare, Salt Lake City;

5 University of Utah, Salt Lake City;

March 19, 2017

Funded by NIH (R01 HL097036, UL1 TR000448)  
and Centers for Medicare & Medicaid Services

# The Problem: Warfarin works, but

## **WARNING: BLEEDING RISK**

- **COUMADIN** can cause major or fatal bleeding. (5.1)
- Perform regular monitoring of INR in all treated patients. (2.1)

## **-----DOSAGE AND ADMINISTRATION-----**

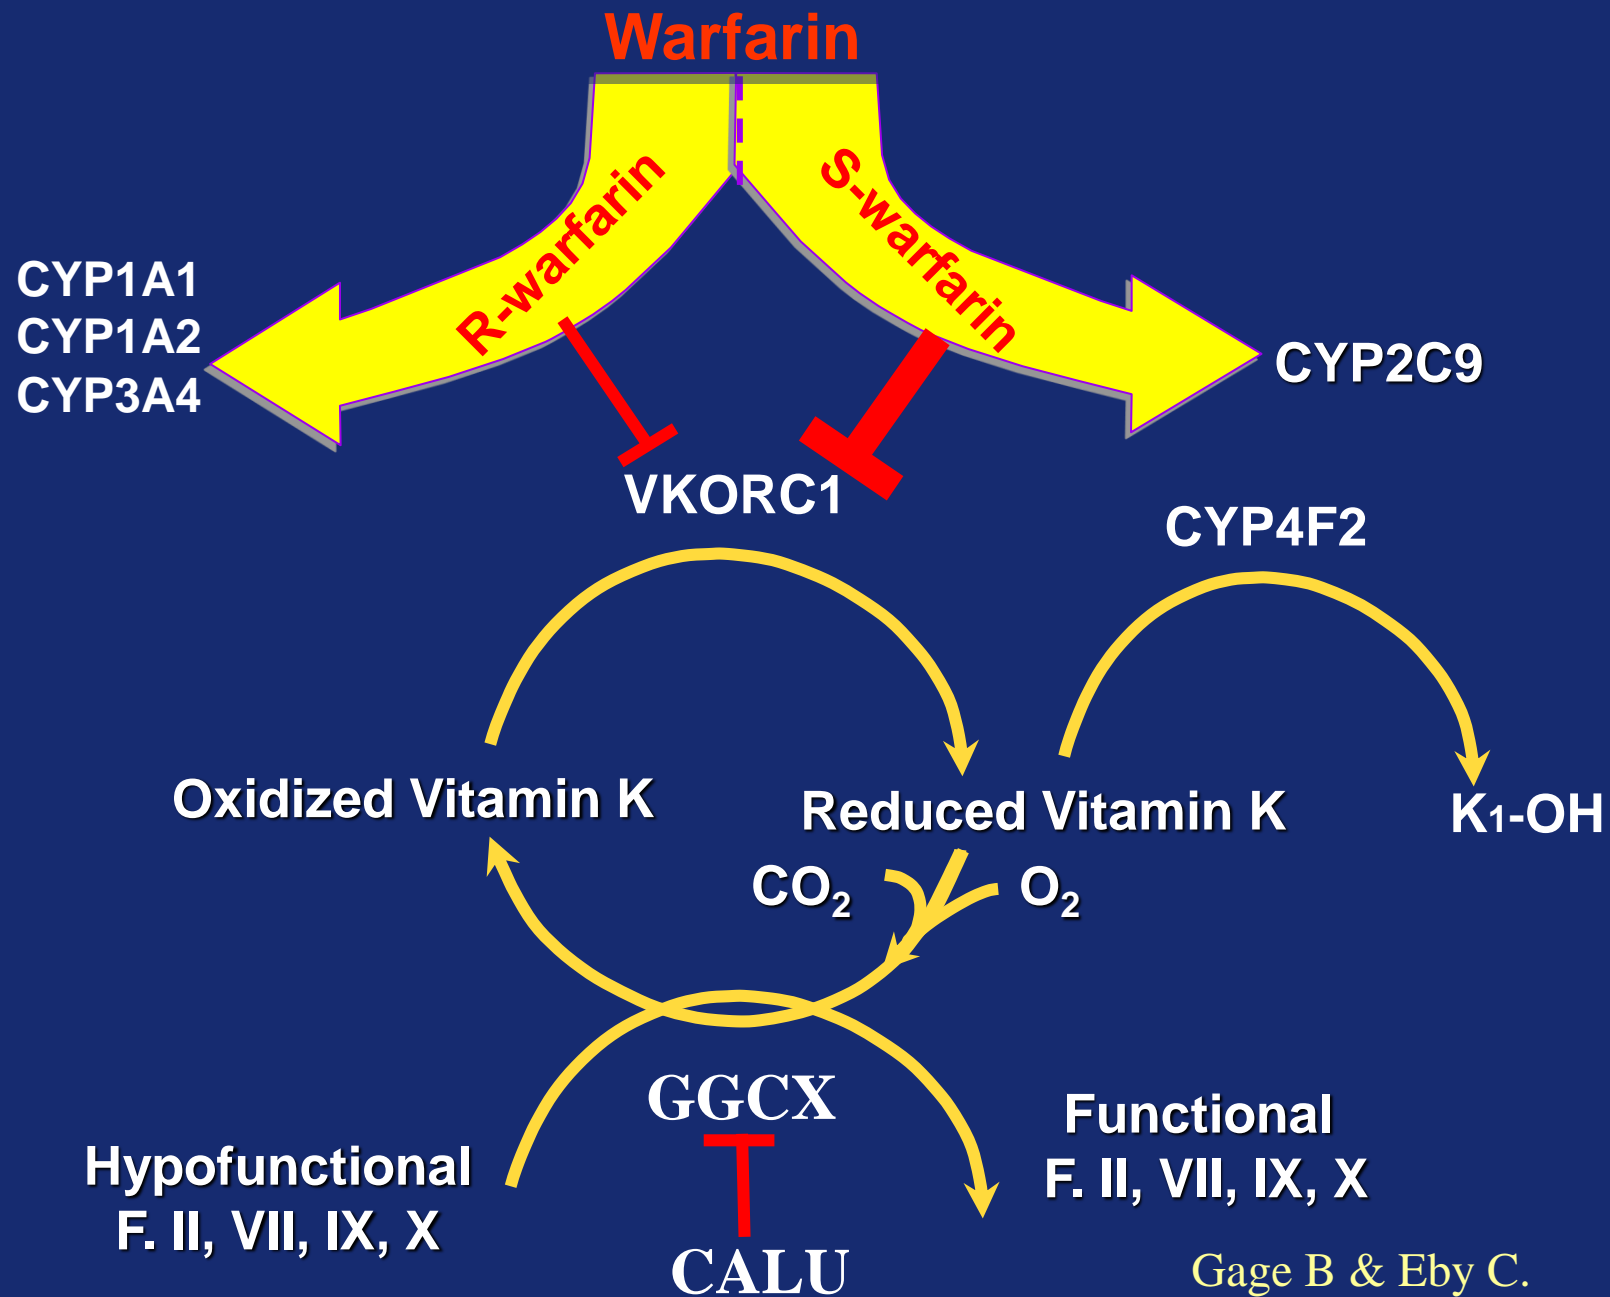

- Individualize dosing regimen for each patient, and adjust based on INR response.
- Knowledge of genotype can inform initial dose selection.

Warfarin causes more emergency department visits among the elderly than any other drug (N. Shehab **JAMA** 2016).

INR = International Normalized Ratio. Values > 3 or 4 predispose to bleeding.

# Genetics Informatics Trial (GIFT) of Warfarin Therapy for DVT Prevention

- Hypothesis: Pharmacogenetic dosing of warfarin therapy decreases the rate of adverse events vs. clinical-algorithm dosing

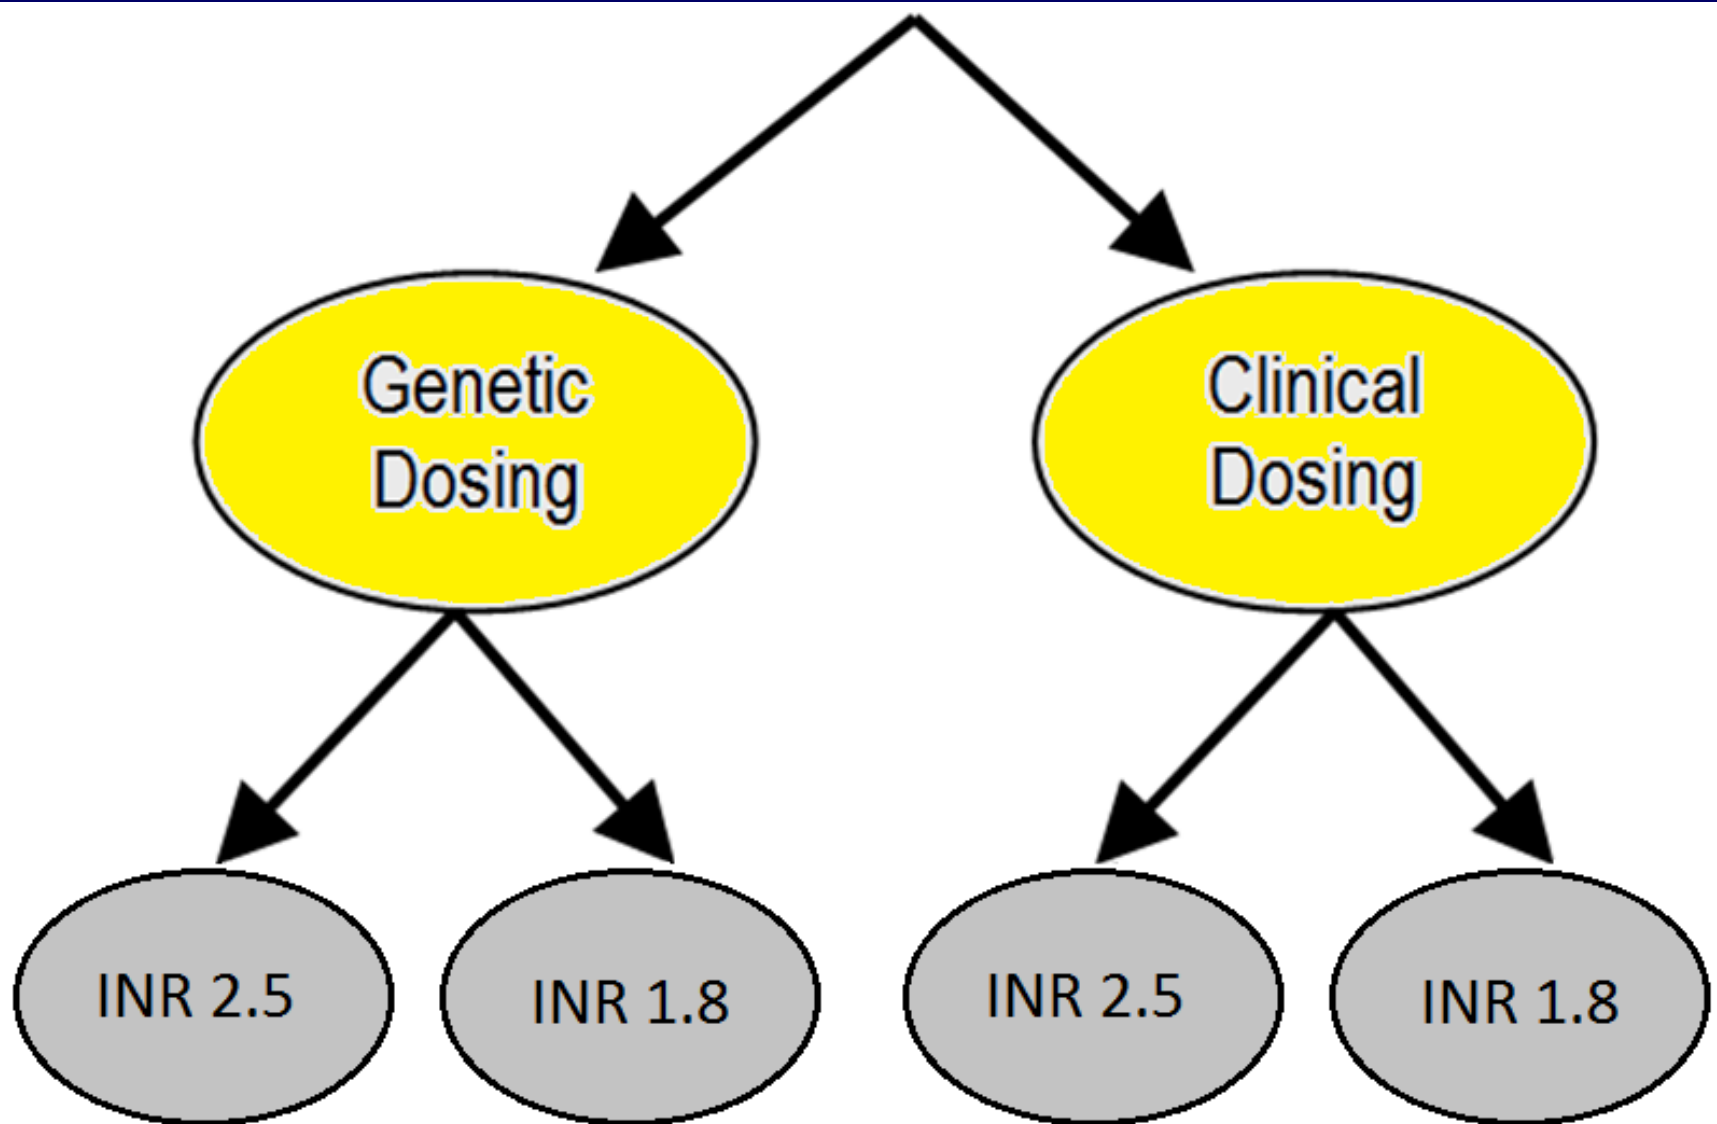

Gage B & Eby C.  
*Pharmacogenomics J.* 2004

# Warfarin Pharmacogenetics

- Cytochrome P450 2C9 (CYP2C9) SNPs slow S-warfarin metabolism
- VKORC1-1639 G>A Vitamin K epoxide reductase increases warfarin sensitivity
- CYP4F2 V433M reduces vitamin K clearance

# 2 x 2 Factorial Design

# Genotyping Strategy

- Initially: Genotyping at clinical sites with retrospective confirmation and DNA banking by Central Laboratory
- Later: Central laboratory provided pre-surgery genotyping for all clinical sites
- Genotype Method: Predominantly GenMarkDx eSensor instrument and reagents

# Randomization & Double Blinding

- Randomized 1:1 to genetic vs. clinical dosing
  - stratified by arthroplasty site, self-identified race, and center: HSS, Intermountain Healthcare, Rush, University of Utah, UT Southwestern, and WUSTL
- Participants and study personnel were blind to study arm and genotype, but not to warfarin dose

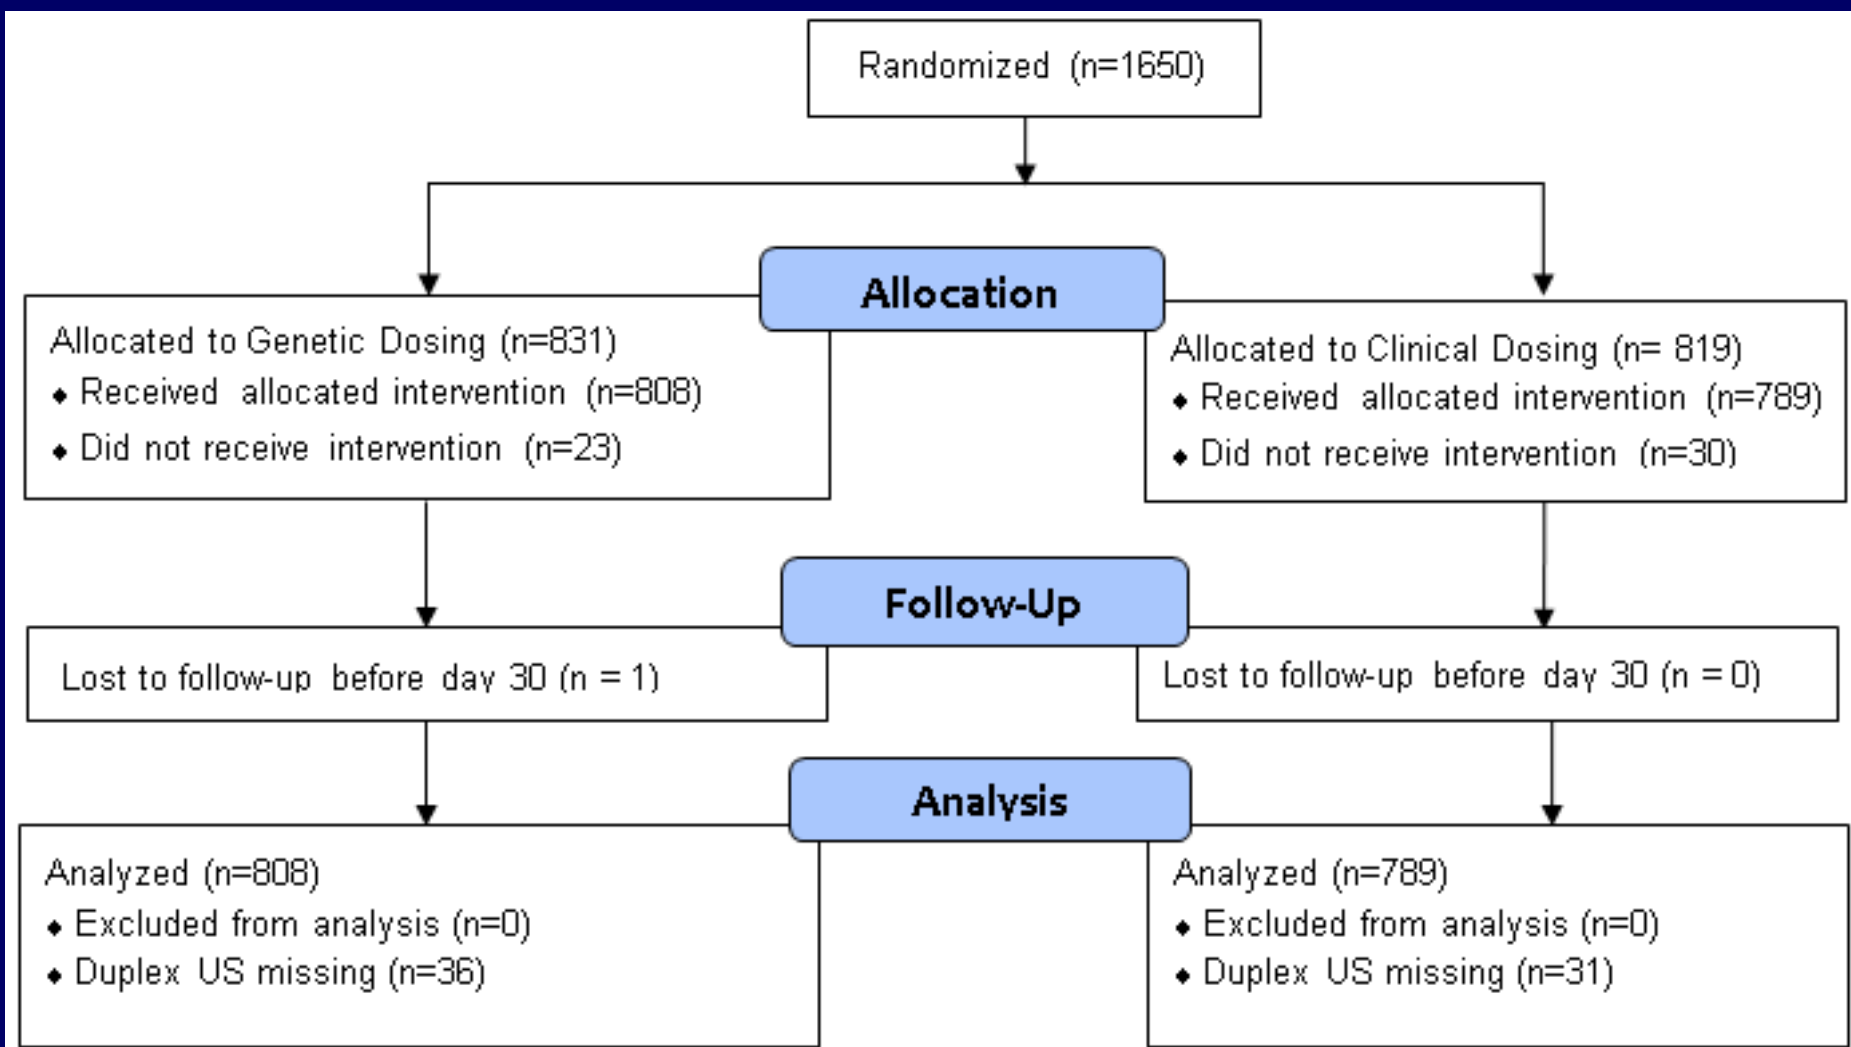

# Primary Outcome Was a Composite of:

- Major bleeding within 30 days,
- $\text{INR} \geq 4$  within 30 days,
- Death within 30 days, and
- Venous thromboembolism (VTE) confirmed by objective testing within 60 days of arthroplasty
  - Patients were screened for DVT using Duplex US

# Statistical Analyses

- Modified intention-to-treat basis
  - included all randomized participants who received 1+ doses of warfarin.
- A priori high-risk subgroup:
  - Participants whose clinical and genetic predicted doses (on day 1) differed by  $\geq 1.0$  mg/day.
- Two-sided alpha of 0.05, partitioned:
  - 0.044 alpha required in total cohort
  - Remaining alpha in high-risk subgroup
- 1600 participants provided 80% power

# GIFT CONSORT Diagram

# GIFT Participants

| Variable                     | Genetic<br>N=808 | Clinical<br>N=789 |
|------------------------------|------------------|-------------------|
| Age, years: mean (SD)        | 72.2 (5.3)       | 72.0 (5.5)        |
| Indication: N (%)            |                  |                   |
| Hip Replacement              | 207 (25.6)       | 199 (25.2)        |
| Knee Replacement             | 601 (74.4)       | 590 (74.8)        |
| Female: N (%)                | 522 (64.6)       | 496 (62.9)        |
| Race: N (%)                  |                  |                   |
| African American             | 52 (6.4)         | 50 (6.3)          |
| American Indians or Native   | 1 (0.1)          | 0 (0.0)           |
| Asian or Indian Subcontinent | 16 (2.0)         | 13 (1.7)          |
| Caucasian                    | 735 (91.0)       | 719 (91.1)        |
| Statin†: N (%)               | 365 (45.2)       | 402 (51.0)        |
| Diabetes: N (%)              | 116 (14.4)       | 105 (13.3)        |

† P = 0.02.

# Primary Results (N = 1597)

| Endpoint                 | Genotype Group,<br>N = 808, % (N) | Clinical Group,<br>N = 789, % (N) | P-value |
|--------------------------|-----------------------------------|-----------------------------------|---------|
| Major bleed (days 1-30)  | 0.25% (2)                         | 1.01% (8)                         | 0.062   |
| INR $\geq$ 4 (days 1-30) | 6.9% (56)                         | 9.8% (77)                         | 0.041   |
| VTE (days 1-60)          | 4.1% (33)                         | 4.8% (38)                         | 0.48    |
| Death (days 1-30)        | 0.0% (0)                          | 0.0% (0)                          | 1.00    |
| <b>Total</b>             | 10.8% (87)                        | 14.7% (116)                       | 0.018   |

Genetic dosing reduced the relative risk of adverse outcomes by 27% (RR=0.73; 95% CI: 0.56 – 0.95).

# Benefit of Genetic Dosing Was Consistent:

- There was no significant interaction in any of these subgroups
  - African-Americans
  - *CYP2C9* genotype
  - Target INR 2.5 vs. 1.8
  - Hip vs. knee arthroplasty

# Secondary Outcome: Percentage of Time in the Therapeutic Range (PTTR) During Days 4-28 of Warfarin Therapy

| Analyses                 | Genotype-Group |      | Clinical Group |      | Mean Difference |         |
|--------------------------|----------------|------|----------------|------|-----------------|---------|
|                          | N              | PTTR | N              | PTTR | (95% CI)        | P Value |
| <b>Overall</b>           | 803            | 54.7 | 785            | 51.3 | 3.4 (1.1, 5.8)  | 0.004   |
| High-risk                | 321            | 55.5 | 333            | 48.4 | 7.0 (3.4, 10.6) | 0.0002  |
| Stratified by Target INR |                |      |                |      |                 |         |
| Target 2.5 (2.0-3.0)     | 399            | 56.2 | 389            | 50.4 | 5.8 (2.5, 9.1)  | 0.0006  |
| Target 1.8 (1.5-2.1)     | 404            | 53.3 | 396            | 52.1 | 1.1 (-2.2, 4.5) | 0.51    |

# GIFT Conclusions

- Algorithm-assisted warfarin dosing is safe
  - Dosing algorithms from WarfarinDosing.org should be integrated into EMRs
- Genotype-guided dosing reduced the relative risk of adverse outcomes by 27%
  - Improved INR control, especially among high-risk subgroup.
