

**Transcatheter or Surgical Aortic Valve
Replacement in Intermediate Risk Patients
with Aortic Stenosis:
Final Results from the PARTNER 2A Trial**

Craig R. Smith, MD

on behalf of the PARTNER Trial Investigators

ACC 2016 | Chicago | April 2, 2016

Background (1)

- In PARTNER 1, transcatheter aortic valve replacement (TAVR) was superior to standard therapy in patients with symptomatic severe aortic stenosis who were not candidates for surgery AND was equivalent to surgery in high-risk patients.

Pocock, Ph.D., for the PARTNER Trial Investigators*

Background (2)

- However, early operator experiences using first generation TAVR systems resulted in frequent peri-procedural complications.
- Lower profile second generation TAVR systems have been associated with improved clinical outcomes.
- Recently, there has been a worldwide trend to extend TAVR therapy to lower-risk patients, but rigorous evidence-based medicine validation is lacking.

Purpose

To compare the safety and effectiveness of the second generation SAPIEN XT TAVR system with conventional surgery in *intermediate-risk* patients using rigorous clinical trial methodologies.

Inclusion Criteria

- **Severe AS:** Echo-derived AVA $< 0.8 \text{ cm}^2$ (or AVA index $< 0.5 \text{ cm}^2/\text{m}^2$) and mean AVG $> 40 \text{ mm Hg}$ or peak jet velocity $> 4.0 \text{ m/s}$
- **Cardiac Symptoms:** NYHA Functional Class $\geq \text{II}$
- **Intermediate Risk:**
 1. Determined by the multi-disciplinary Heart Team
 2. Using a guideline STS $\geq 4\%$, and
 3. Adjudicated by case review committee

Key Exclusion Criteria

Anatomic:

- Aortic annulus diameter < 18 mm or > 27 mm (echo or CT)
- Bicuspid AV or predominant AR ($> 3+$)
- Severe LV dysfunction (LVEF $< 20\%$)
- Untreated CAD requiring revascularization with either unprotected LM coronary disease or Syntax score > 32
- Pre-existing surgical valve in any position

Clinical:

- Serum Cr > 3.0 mg/dL or dialysis dependent
- Acute MI within 1 month
- CVA or TIA within 6 months
- Hemodynamic instability
- Life expectancy < 24 months

*First Implant Oct 30, 2012

Primary Endpoint

- Non-hierarchical composite of *all-cause mortality or disabling stroke* at two years*
- Intention-to-treat population is the primary analysis;
 - As-Treated (AT) population also a pre-specified, powered analysis
 - Transfemoral (TF) subgroup pre-specified
- All patients followed for at least 2 years
- Event rates by Kaplan-Meier estimates

* Disabling stroke = CEC adjudicated stroke by a neurologist with a modified Rankin score of 2 or greater at 90-day evaluation

Other Important Endpoints

VARC 2 Definitions

Safety

- Cardiac mortality
- Major vascular complications
- All strokes and TIAs
- Repeat hospitalizations
- Peri-procedural MIs
- Acute kidney injury
- Life-threatening or disabling bleeding
- New permanent pacemakers
- New onset atrial fibrillation
- Repeat AV intervention
- Endocarditis

Efficacy

- NYHA class
- QOL instruments
- 6-minute walk test
- Days alive out-of-hospital
- ICU and index hospital LOS

Echo Valve Performance

- Mean AV gradient
- Effective orifice area (and index)
- LV function (ejection fraction)
- Paravalvular regurgitation (PVR)

Statistical Analysis Plan

- *Primary hypothesis* is non-inferiority of test (SAPIEN XT) vs. control (surgery) for all-cause mortality or disabling stroke at 2 years (non-hierarchical)
- *Non-inferiority ratio*: 1.20
- *One-sided alpha*: 0.025
- *Assumptions* (for 1:1 randomization)
 - Event rate: 30% in both trial arms
 - Power: 80%
- *Sample size*: 1744 patients (adjusted to 2,000 patients to account for lost to follow-up and other trial contingencies)

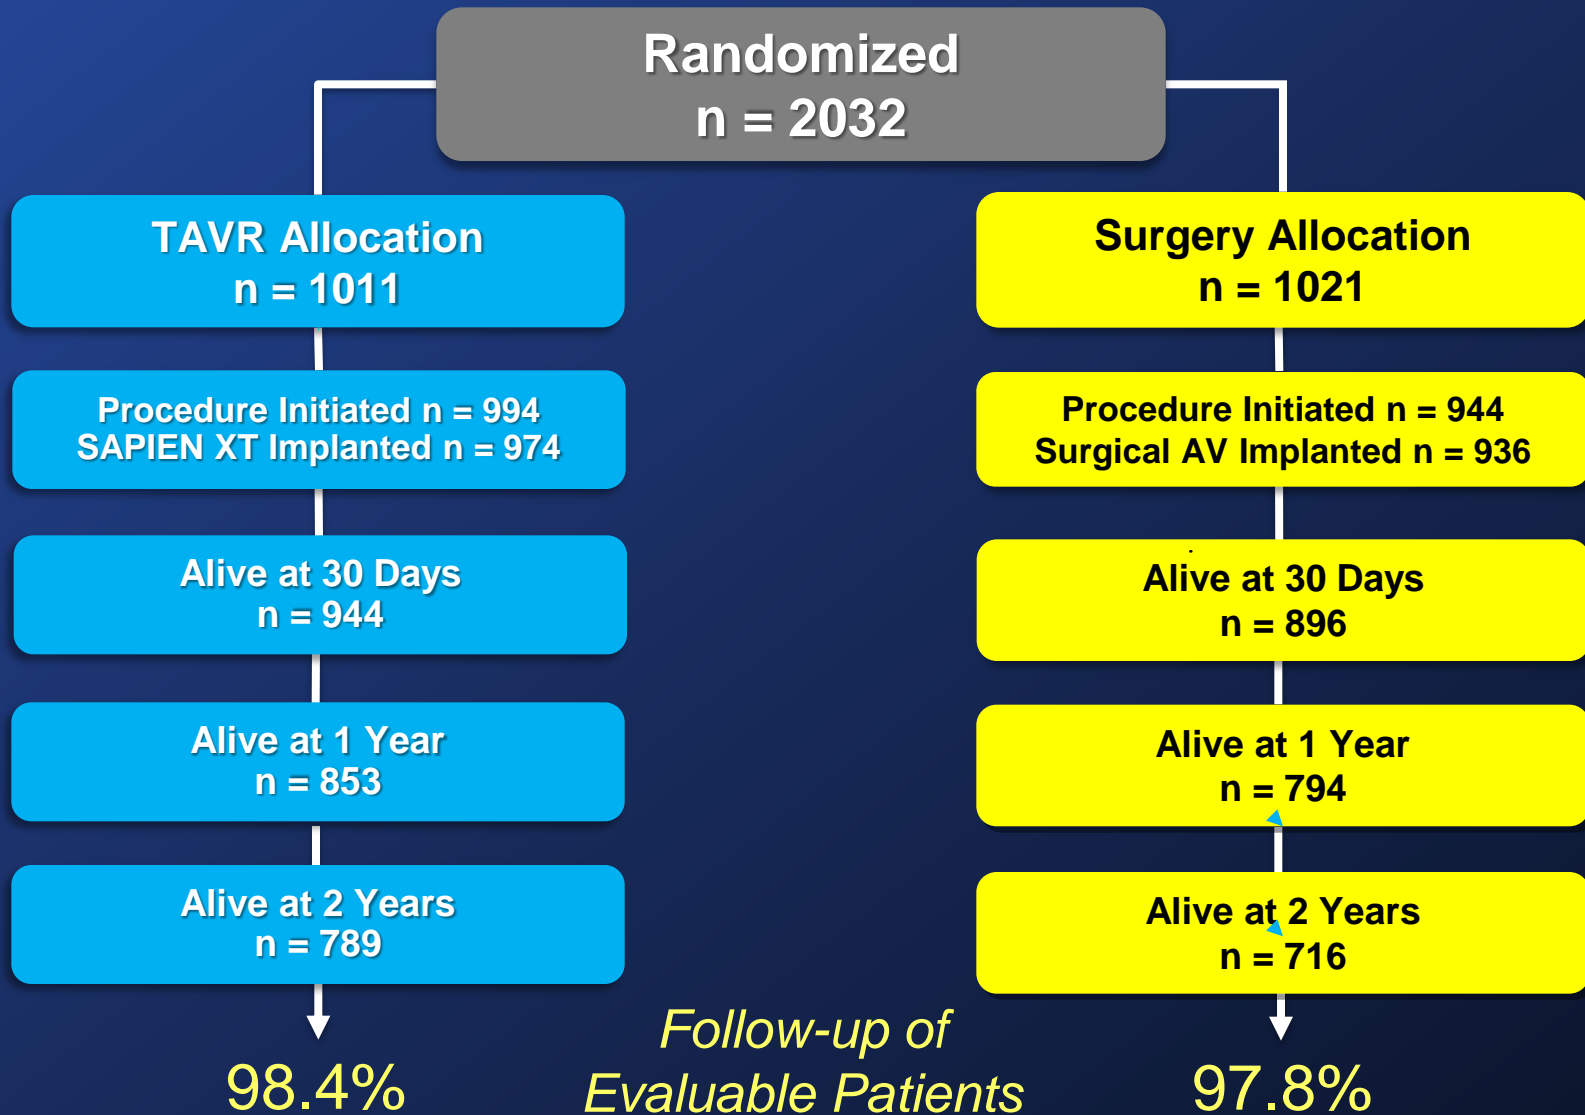

Study Methodology

- Every patient reviewed (including imaging studies) by multi-disciplinary Heart Team AND case review committee
- Systematic assessment by neurologists before and after index procedures for ascertainment of neurologic events
- MDCT evaluation of annulus dimensions recommended but not consistently applied
- In patients with CAD requiring revascularization: treatment (PCI or CABG) allowed (unless unprotected left main disease or Syntax score > 32) at the discretion of the Heart Team
- 100% CEC adjudication of all major clinical events (VARC 2 definitions whenever possible)

The PARTNER 2A Trial

Conclusions (1)

In intermediate-risk patients with symptomatic severe aortic stenosis, results from the PARTNER 2A trial demonstrated that...

- TAVR using SAPIEN XT and surgery were similar (non-inferior) for the primary endpoint (all-cause mortality or disabling stroke) at 2 years.
- In the transfemoral subgroup (76% of patients), TAVR using SAPIEN XT significantly reduced all-cause mortality or disabling stroke vs. surgery (ITT: $p = 0.05$, AT: $p = 0.04$).

The PARTNER 2A Trial

Conclusions (2)

- Other clinical outcomes:
 - TAVR reduced AKI, severe bleeding, new AF, and LOS
 - Surgery reduced vascular complications and PVR
- The SAPIEN XT valve significantly increased echo AVA compared to surgery.
- In the SAPIEN XT TAVR cohort, moderate or severe PVR, but not mild PVR, was associated with increased mortality at 2 years.

The PARTNER 2A Trial

Clinical Implications

- *The results from PARTNER 2A support the use of TAVR as an alternative to surgery in intermediate risk patients, similar to those included in this trial.*
- In patients who are candidates for transfemoral access, TAVR may result in additional clinical advantages.
- Long-term durability assessments of transcatheter bioprosthetic valves are still lacking and extrapolation of these findings to low-risk patients requires further clinical trial validation.
