

# **A Randomized Evaluation of the SAPIEN XT Transcatheter Valve System in Patients with Aortic Stenosis Who Are Not Candidates for Surgery: PARTNER II, Inoperable Cohort**

**Martin B. Leon, MD**  
on behalf of The PARTNER Trial Investigators

ACC 2013 | San Francisco | March 10, 2013

# **Disclosure Statement of Financial Interest**

**Martin B. Leon, MD**

Within the past 12 months, I or my spouse/partner have had a financial interest/arrangement or affiliation with the organization(s) listed below.

## **Affiliation/Financial Relationship**

- Grant/Research Support
- Consulting Fees/Honoraria
- Major Stock Shareholder/Equity

## **Company**

- Abbott, Boston Scientific, Edwards Lifesciences, Medtronic
- None
- Sadra, Claret, Valve Medical, Apica

# Background (1)

- In the PARTNER I randomized trials, patients with symptomatic severe aortic stenosis, treated using the balloon-expandable SAPIEN transcatheter heart valve system, had reduced mortality compared with standard therapy in patients who could not undergo surgery ("inoperable") and had similar mortality compared to surgical AVR in patients who were at high-risk for surgery.

Pocock, Ph.D., for the PARTNER Trial Investigators\*

## Background (2)

- However, SAPIEN was associated with peri-procedural complications, including strokes, vascular events, and paravalvular regurgitation.
- The new lower-profile SAPIEN XT, currently in general clinical use around the world, incorporates important enhancements to the valve support frame, the valve leaflet geometry, and the delivery system which may be associated with improved clinical outcomes.

# Purpose of PARTNER II Inoperable Cohort

- To compare the safety and effectiveness of the new SAPIEN XT versus the FDA-approved SAPIEN in a randomized controlled trial for patients with symptomatic severe aortic stenosis who cannot have surgery (“inoperable”).
- To apply rigorous clinical trial methodologies including systematic serial neurologic assessments and VARC 2 definitions\* for clinical outcomes.

# The PARTNER II Inoperable Cohort Study Design

## Symptomatic Severe Aortic Stenosis

### ASSESSMENT by Heart Valve Team

Inoperable

### ASSESSMENT: Transfemoral Access

1:1 Randomization

n = 560  
Randomized  
Patients

TF TAVR  
SAPIEN XT

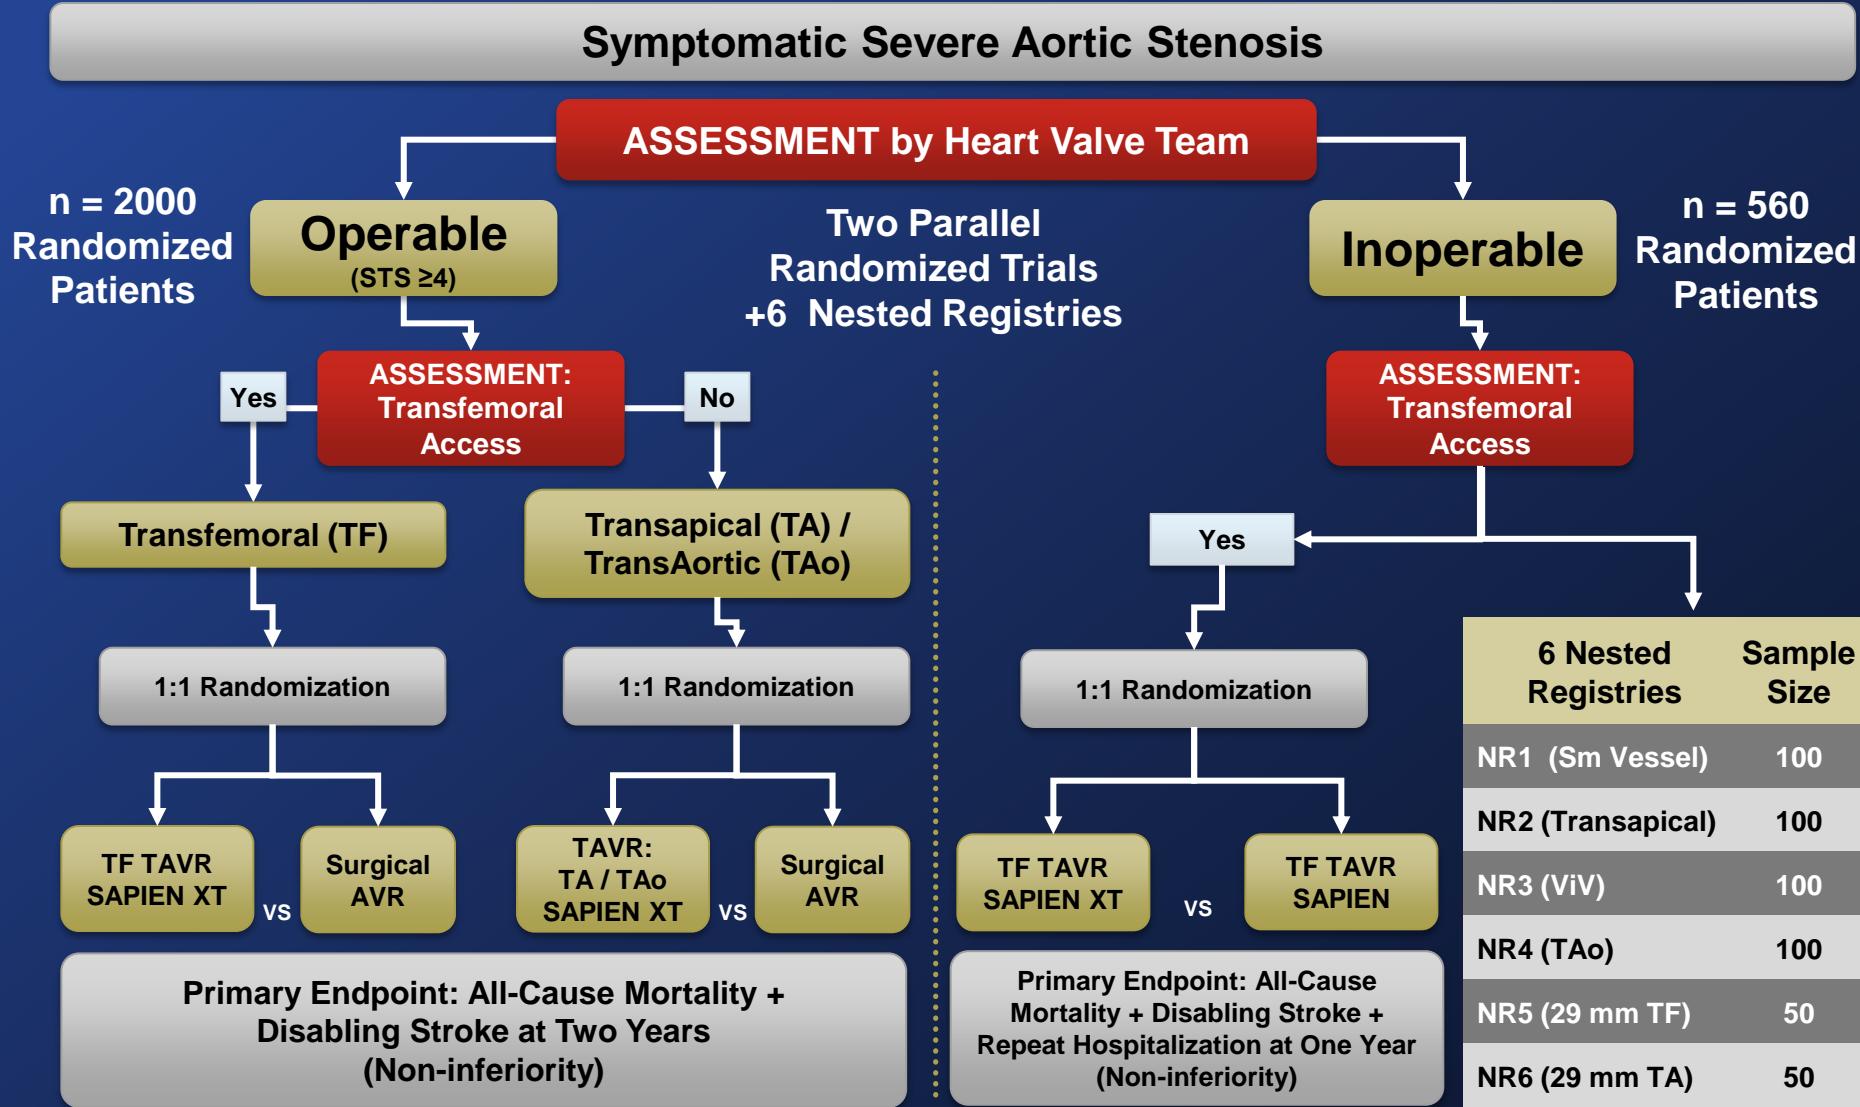

vs

TF TAVR  
SAPIEN

Primary Endpoint: All-Cause Mortality + Disabling  
Stroke + Repeat Hospitalization at One Year  
(Non-inferiority)

# The PARTNER II Trial

## Study Design

# Primary Endpoint

- A non-hierarchical composite of all-cause mortality, disabling stroke\*, and re-hospitalization for symptoms of aortic stenosis and/or complications of the valve procedure.
- Intention-to-treat population, all patients followed for at least one year, non-inferiority trial arm comparison.

\* Disabling stroke = CEC adjudicated stroke event by a neurologist with a modified Rankin score of 2 or greater at 90-day evaluation

# Other Important Endpoints

## VARC 2 Definitions

### **SAFETY**

- Cardiovascular mortality
- Major vascular complications
- All strokes and TIAs
- Peri-procedural Mis
- Acute kidney injury
- Life-threatening or disabling bleeding
- No. of transfusions
- New permanent pacemakers
- New onset atrial fibrillation
- $\geq 2$  THV implants
- Repeat intervention
- Endocarditis

### **EFFICACY**

- NYHA class
- QOL instruments
- 6-minute walk test
- Days alive out-of-hospital
- ICU and index hospital LOS

### **ECHO VALVE PERFORMANCE**

- Mean and peak AV gradient
- Effective orifice area (and index)
- LV function (ejection fraction)
- Paravalvular and total AR
- Structural valve deterioration

# Inclusion Criteria

- **Severe AS:** Echo-derived AVA < 0.8 cm<sup>2</sup> (or AVA index < 0.5 cm<sup>2</sup>/m<sup>2</sup>) and mean AVG > 40 mm Hg or peak jet velocity > 4.0 m/s
- **Cardiac Symptoms:** NYHA Functional Class ≥ II
- **“Inoperable”:** Risk of death or serious irreversible morbidity as assessed by a cardiologist and two surgeons must exceed 50%

# Key Exclusion Criteria

## Anatomic:

- Aortic annulus diameter (echo measurement) < 18 mm or > 25 mm
- Iliac-femoral anatomy precluding safe sheath insertion (vessel size  $\geq$ 7 mm diameter)
- Severe LV dysfunction (LVEF < 20%)
- Untreated CAD requiring revascularization

## Clinical:

- Serum Cr > 3.0 mg/dL or dialysis dependent
- Acute MI within 1 month
- CVA or TIA within 6 months
- Hemodynamic instability

# Edwards SAPIEN vs SAPIEN XT Transcatheter Heart Valves

## NEW FRAME GEOMETRY

- Less metal content
- Lower crimp profile

## NEW FRAME MATERIAL

- Cobalt-chromium
- Greater tensile and yield strength

## NEW LEAFLET GEOMETRY

- Partially closed

### SAPIEN THV

# Study Methodology

- Every case reviewed by web-based conference call before enrollment
- All patients followed for at least one year
- Primary analysis performed by intention-to-treat (ITT), although as-treated (AT) analyses performed when appropriate
- Event rates as Kaplan-Meier estimates
- Composite analyses pre-specified
- 100% data monitoring of clinical events
- All 30-day events CEC adjudicated (>99%)
- 1-year primary endpoint events = CEC adjudicated (89%)

# Baseline Patient Characteristics: Demographics (ITT)

| Characteristic                          | SAPIEN<br>(n=276) |                | SAPIEN XT<br>(n=284) |                | p-value |

No. of Echos

| SAPIEN    | 229 | 215 | 112 |
|-----------|-----|-----|-----|
| SAPIEN XT | 256 | 233 | 117 |

# Echocardiographic Findings: Mean & Peak Gradients (AT, Valve Implant)

# Paravalvular Aortic Regurgitation (AT, Valve Implant)

# Conclusions (1)

***In the inoperable cohort of the PARTNER II trial,  
comparing the SAPIEN versus the SAPIEN XT  
THV systems...***

- During the TAVR procedure,
  - SAPIENT XT treatment was associated with reductions in anesthesia time ( $p = 0.02$ ), multiple valve implants ( $p = 0.05$ ), aborted procedures ( $p = 0.06$ ), and the need for IABP hemodynamic support ( $p = 0.06$ ).

# Conclusions (2)

***In the inoperable cohort of the PARTNER II trial, comparing the SAPIEN versus the SAPIEN XT THV systems...***

- At 30 days,
  - All-cause mortality and disabling strokes were similar (Mortality: SAPIEN 5.1% vs. SAPIEN XT 3.5%; Strokes: SAPIEN 3.0% vs. SAPIEN XT 3.2%)
  - Major vascular complications were reduced after SAPIENT XT (from 15.5% to 9.6%,  $p = 0.04$ ), including perforations, dissections, and hematomas
  - All other clinical endpoints were similar

# Conclusions (3)

***In the inoperable cohort of the PARTNER II trial, comparing the SAPIEN versus the SAPIEN XT THV systems...***

- At 1 year,
  - All-cause mortality, disabling strokes, and re-hospitalizations were similar, including the non-hierarchical composite primary endpoint (SAPIEN XT 33.9% vs. SAPIEN 34.7%, non-inferiority p-value = 0.0034)
  - Improvement in NYHA class was similar
  - Echo valve performance (EOA and gradients) was similar

# Implications

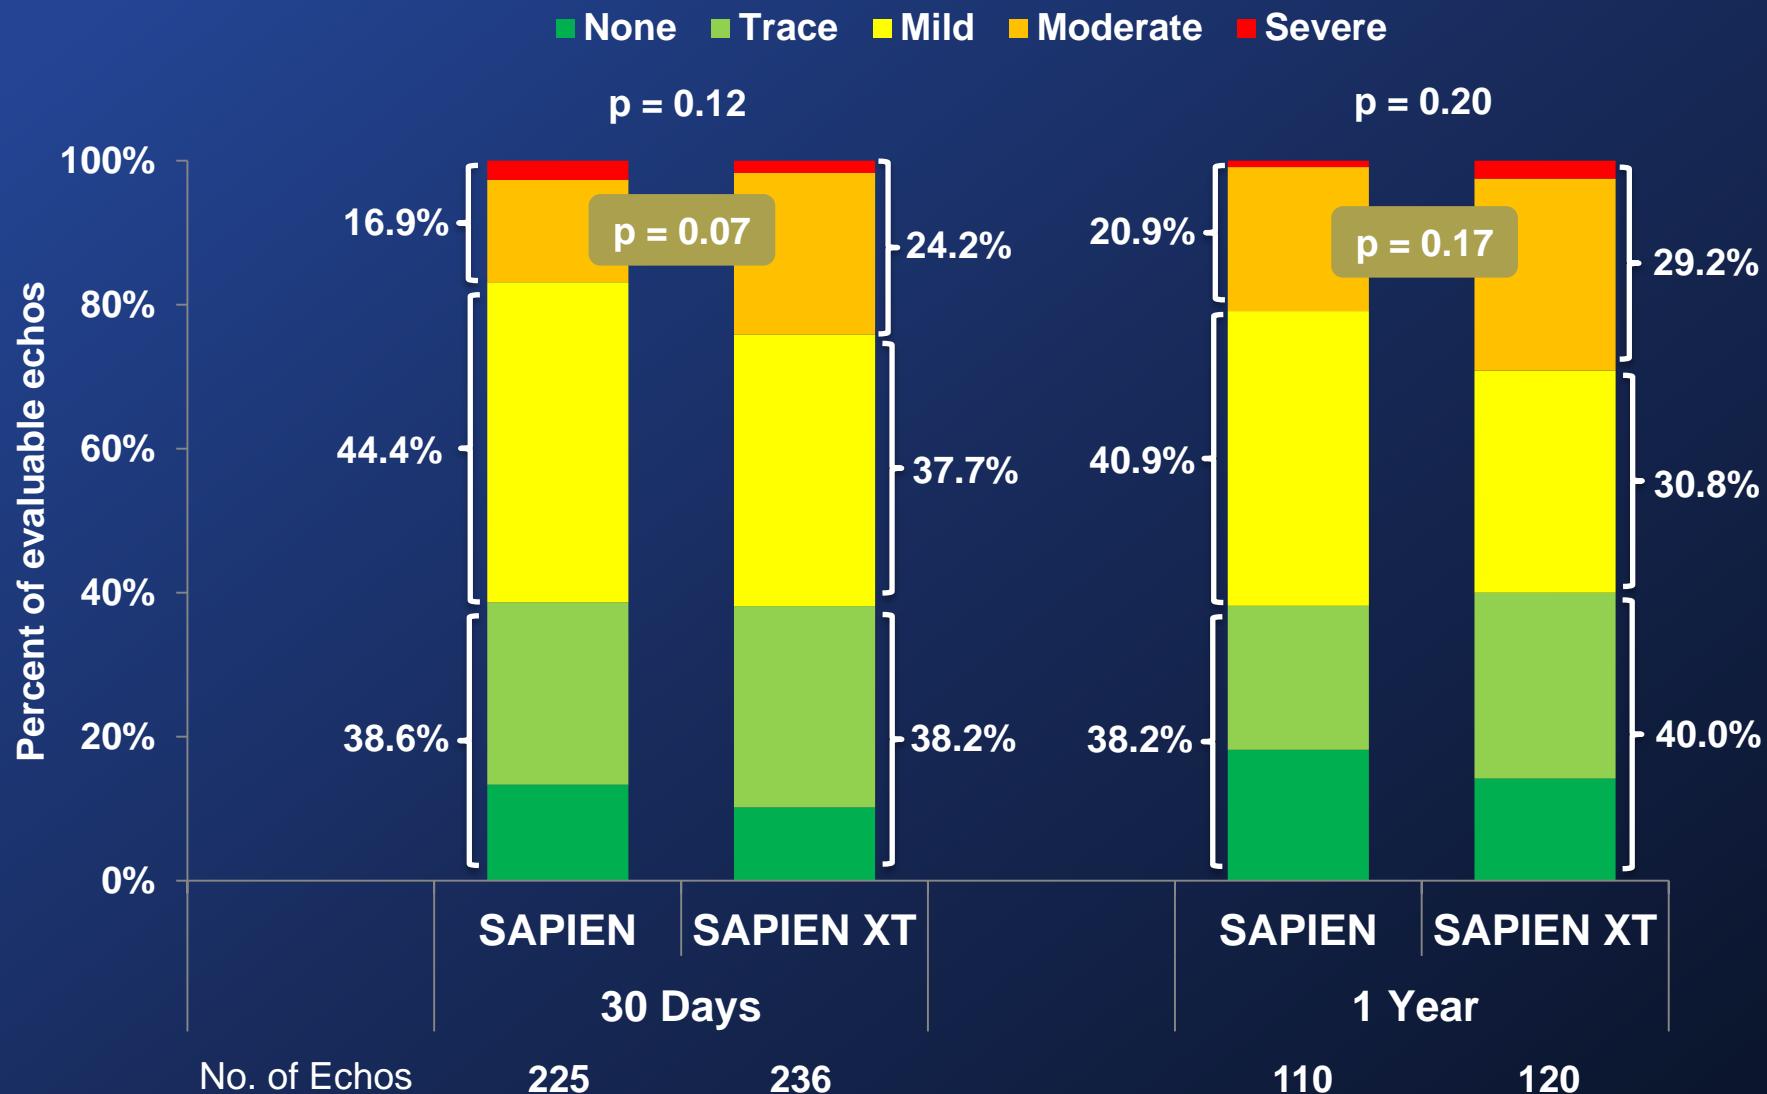

*In the inoperable cohort of The PARTNER II Trial, the new lower profile SAPIEN XT THV system was associated with...*

- Improved procedural outcomes
- Similar low 30-day mortality and strokes
- Reduced vascular complications
- Similar 1-year major clinical events and valve performance

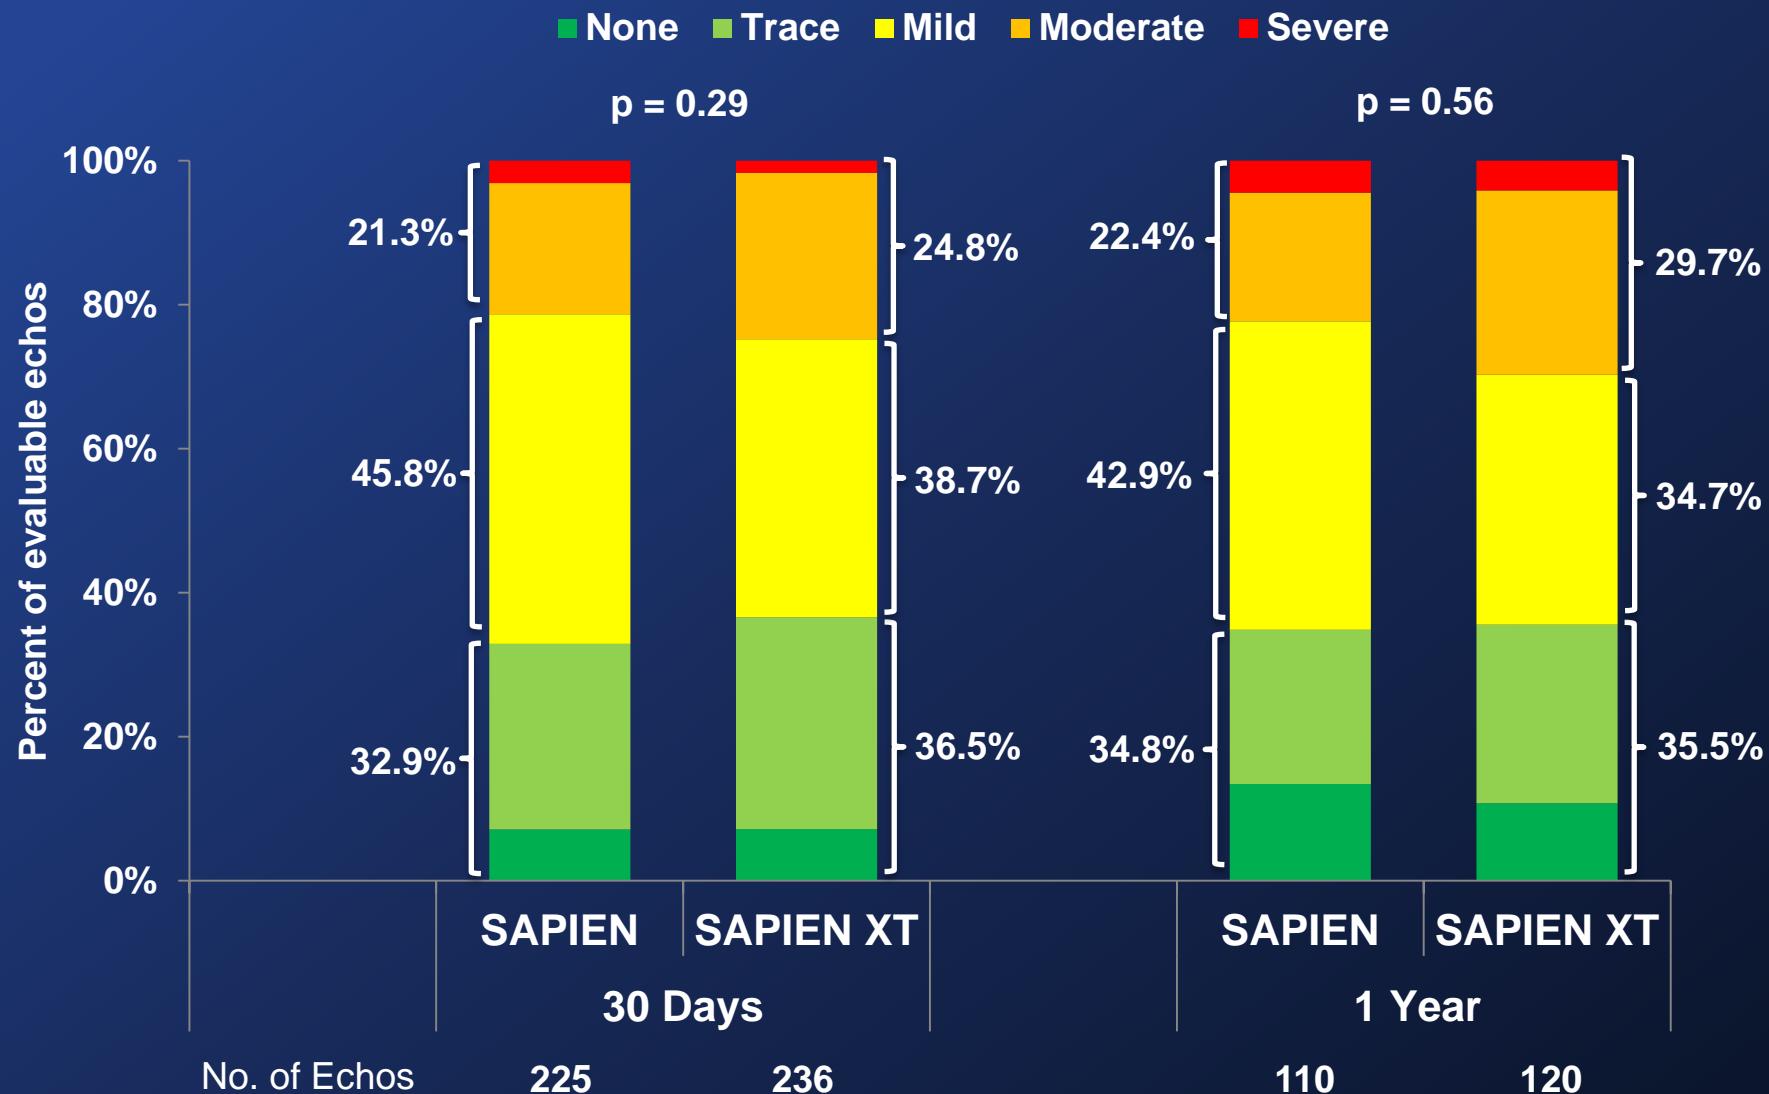

*Therefore, SAPIEN XT represents a worthwhile advance with incremental clinical value and is the preferred balloon-expandable THV system.*

# Statistical Analysis Plan

- Primary hypothesis is non-inferiority of test (SAPIEN XT) vs. control (SAPIEN) for all-cause mortality + disabling stroke + re-hospitalization at 1 year (non-hierarchical)
- **Non-inferiority ratio:** 1.35
- **One-sided alpha:** 0.025
- **Hypothesis testing:** upper bound of the 95% CI of the ratio of the primary endpoint (KM estimates test/control) < 1.35
- Assumptions (for 1:1 randomization)
  - Event rate: 43.6% in both trial arms
  - Power: 80%
- **Sample size:** 458 patients (adjusted to 500 patients to account for lost to follow-up and other trial contingencies)
